Q-Plex™ Multiplex/Single ELISA Arrays

More Results From Each Precious Sample

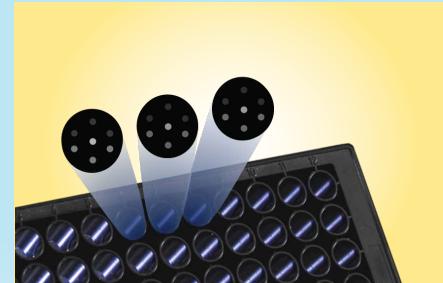

Established in 2005, Quansys Biosciences, Inc. is a Spendlove Research Foundation company. The Spendlove Research Foundation was created in 1989 through an endowment by Dr. Rex S. and Reta Spendlove. Dr. Spendlove is the founder of HyClone Laboratories, a leading provider of cell culture products throughout the world. Portions of the original HyClone business are now part of GE Healthcare and Thermo Fisher Scientific. Q-Plex™ Array is now available in Malaysia through Mbioscience Solutions Sdn Bhd.

What is Q-Plex™ Array?

The Q-Plex™ Array Technology is a fully quantitative multiplex ELISA capable of measuring up to 25 distinct analytes per sample. Quantify cytokines, chemokines, hormones, and other common disease indicating proteins with custom or standard kits.

Each kit runs with a recommended 50 µL of sample being added to each well of a 96-well plate. Wells contain a defined array of capture microspots deposited (or printed) at the bottom of the well. Individual assays can be sandwich, competitive or indirect ELISA. Detection of the array is performed using a **Q-View™ Imager** or other alternative imaging systems. The image is processed and data is reported using the **Q-View™ Software** that comes with each kit.

- Measuring multiple analytes in each well gives you more data for your time and sample
- Fully quantitative results with low pg/mL sensitivity
- Most Q-Plex Arrays run in only 2-3 hours
- Easy-to-use protocol is similar to traditional ELISA making multiplexing simple and intuitive
- Lower price per data point than traditional ELISA and other multiplexing methods

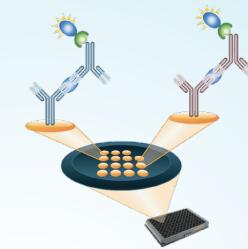

The Q-Plex™ Array is a fully quantitative ELISA-based test where distinct capture antibodies (up to 25) have been absorbed to each well of a 96-well plate in a defined array.

Assay Procedure

PERFORMING THE ASSAY

- Add 50µL of sample
- Wash
- Add mix of detection antibodies specific to kit
- Wash
- Add streptavidin conjugated HRP or IR-Dye

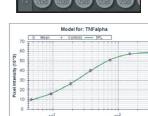

- #### DETECTION OF SAMPLE
- With the addition of substrate, a response is produced
 - If antigen is present the spot emits a signal proportional to the amount of antigen in the sample
 - If no antigen is present, the spot is not visible

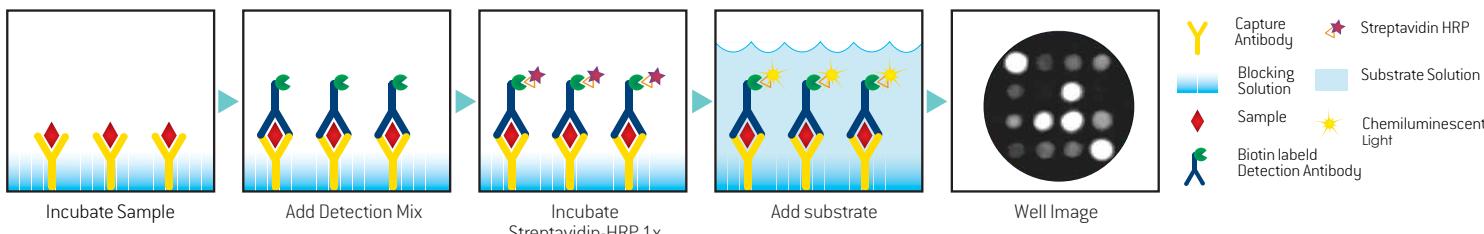

IMAGE CAPTURE

- An image of the plate is taken via a high resolution camera (Q-View Imager or approved gel doc system) or fluorescent scanner (LI-COR Odyssey)
- The image file (TIFF) is imported into Q-View Software and a Q-View Project is created

- #### DATA ANALYSIS IN Q-VIEW
- Spots are automatically found on plate image
 - Intensity of spot response is measured and raw data is generated
 - Regression models used to calculate unknowns
 - Standard curves are calculated and sample and statistical data is exported
